

FUTURES MARKET

Commodity Contracts • Version 1.2.0.0

WHAT IT DOES

Futures Market adds a financial commodity market to the farm's in-game menu. Players can take LONG or SHORT positions on tracked commodities, use leverage, manage margin and unrealized P&L, and let contracts settle at the end of their term. The contracts are financial positions only. They do not represent physical crop delivery.

LIVE COMMODITY PRICES	LONG / SHORT	DYNAMIC COMMODITIES
Tracked commodities move independently through a simulated random-walk price market, so prices continually fluctuate.	Go LONG when expecting a price increase or SHORT when expecting a price decrease.	The market is built to discover producible fill types rather than relying on a fixed hand-written crop list.

CORE TRADING WORKFLOW

1	Open Futures Market	Access the dedicated Futures Market page from the in-game menu.
2	Choose direction	Select LONG or SHORT based on the price movement you are positioning for.
3	Choose commodity	Select the commodity you want to trade from the available market list.
4	Set size and leverage	Choose the contract quantity and leverage, then review the required margin.
5	Review and confirm	Check entry price, direction, quantity, leverage, term and margin before placing the position.

KEY TERMS

ENTRY PRICE	MARGIN	UNREALIZED P&L;
The market price captured when the position is opened.	The amount committed to support the leveraged position.	The current gain or loss if the position were closed at the displayed market price.

MANAGING A POSITION

How the contract behaves after you place the trade

MARGIN, LEVERAGE & RISK

Futures Market uses a 20% margin system and supports up to 5× leverage. Leverage increases the size of the market exposure relative to the cash committed as margin. Because P&L responds to price movement, leverage also increases the speed at which gains or losses develop.

20% MARGIN	UP TO 5×	MARGIN CALLS
Only a fraction of the contract's full notional value is required as margin when the position is opened.	Higher leverage creates greater market exposure from the same amount of committed margin.	Positions that move too far against the account can be force-closed automatically before losses exceed the position's available margin.

LONG VS. SHORT

POSITION	WHAT YOU EXPECT	IF PRICE RISES	IF PRICE FALLS
LONG	Commodity price increases	Position gains	Position loses
SHORT	Commodity price decreases	Position loses	Position gains

HEDGING WITH THE FUTURES MARKET

The market can be used alongside normal farming rather than replacing it. For example, a farmer expecting to harvest corn can open a SHORT corn futures position as protection against a future price decline. The physical corn is still harvested and sold normally. The futures position creates a separate financial gain or loss that can offset part of the commodity-price movement.

- **Physical side:** grow, harvest and sell the crop normally.
- **Futures side:** take a LONG or SHORT financial position based on the price risk you want to manage.
- **No delivery:** the futures contract does not move grain, seed or any other physical product.
- **Settlement:** the position closes at term end or can be closed manually before then.

POSITION MANAGEMENT

1	Monitor the market	Use the Market tab to watch current commodity prices and the direction of price movement.
2	Review open positions	Use Open Contracts to see active positions, margin and unrealized P&L;
3	Close early if desired	A position can be closed before its scheduled term ends.
4	Automatic settlement	At the end of the contract term, the position settles automatically.

MARKET REFERENCE

A quick reference for using Futures Market in normal gameplay

THE THREE MARKET TABS

MARKET	OPEN CONTRACTS	OVERVIEW
View the live simulated commodity market and available prices. Commodities are discovered dynamically from producible fill types.	Review active positions, including direction, size, leverage, margin and unrealized P&L;	Use the account-level dashboard to see active contracts, total margin and overall unrealized P&L;

WHAT HAPPENS TO YOUR MONEY?

1	Open the position	Your farm commits the required margin. The contract records its commodity, direction, quantity, leverage, entry price and term.
2	Price moves	The simulated market changes over time. Your unrealized P&L; changes with the market price.
3	Manage risk	If a position moves too far against the account, the margin-call system can force-close it.
4	Close or settle	Close manually whenever you want, or allow the contract to reach its term and settle automatically.
5	Save and continue	Open positions are saved with the game and are intended to survive a save/reload.

MULTIPLAYER & DEDICATED SERVERS

Orders and position closes are server-authoritative. This keeps shared-farm trading actions synchronized when the mod is used in multiplayer or on a dedicated server.

FINANCIAL CONTRACT	SIMULATED MARKET	COMMUNITY TESTING
The position is a simulated financial instrument. It is not a delivery order for physical commodities.	Prices are generated inside the mod and are not connected to the real Chicago Board of Trade, CME or any external market.	Price behavior, expiration, persistence and unusual map/fill-type combinations are natural areas for continued testing as the mod evolves.

QUICK CHECK BEFORE TRADING

- Choose **LONG** if your position is based on an expected price increase.
- Choose **SHORT** if your position is based on an expected price decrease or you want to offset price risk on physical production.
- Check **quantity + leverage + required margin** before confirming.
- Watch **unrealized P&L** while the position is open.
- Remember that the futures position is financial only. Your physical crop remains separate.
